1. How to Connect To Server Using SSH?

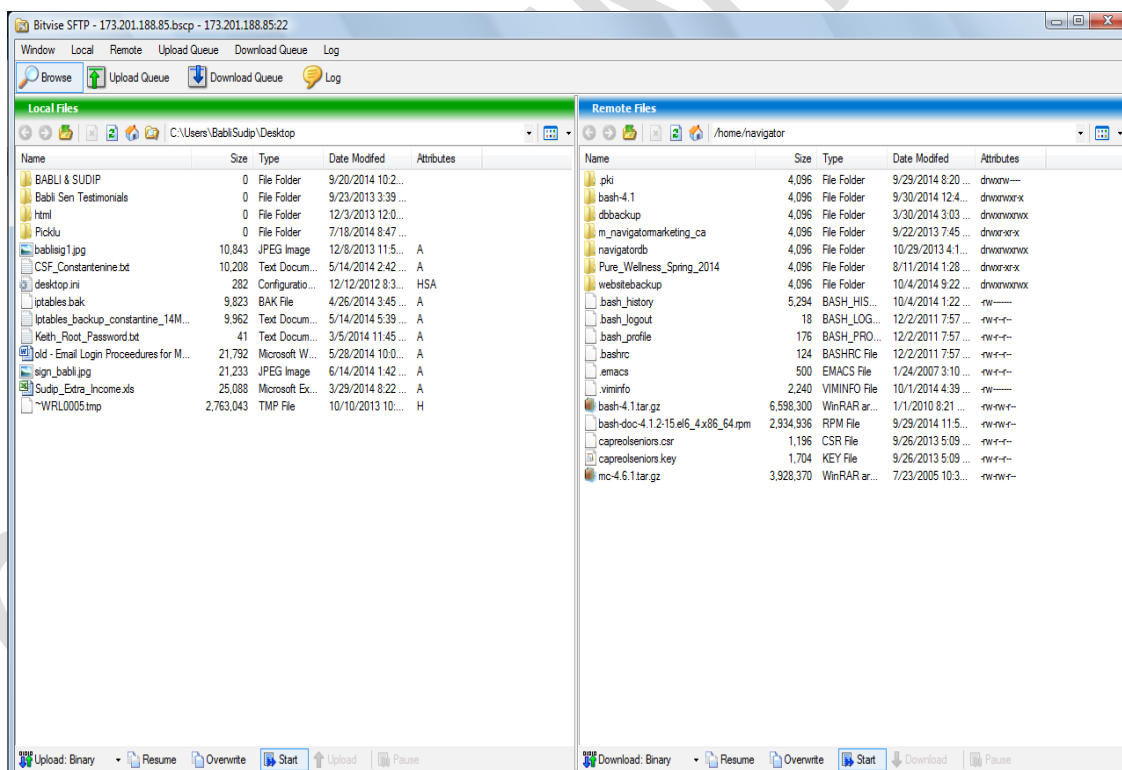

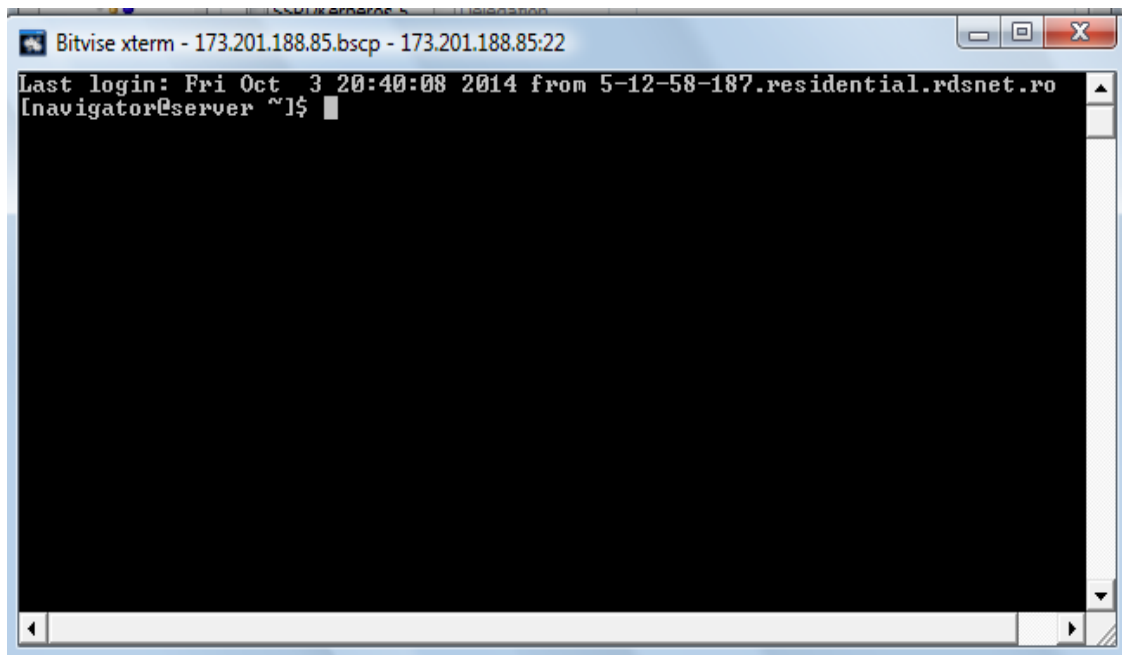

To connect to the server you can use Bitvise SSH client software or Putty SSH client software or any other ssh client software from a windows machine. However you can access the server from a Linux machine using SSH command from the Terminal window.

I am here sharing the screen shots of Bitvise SSH client software for connecting to the server.

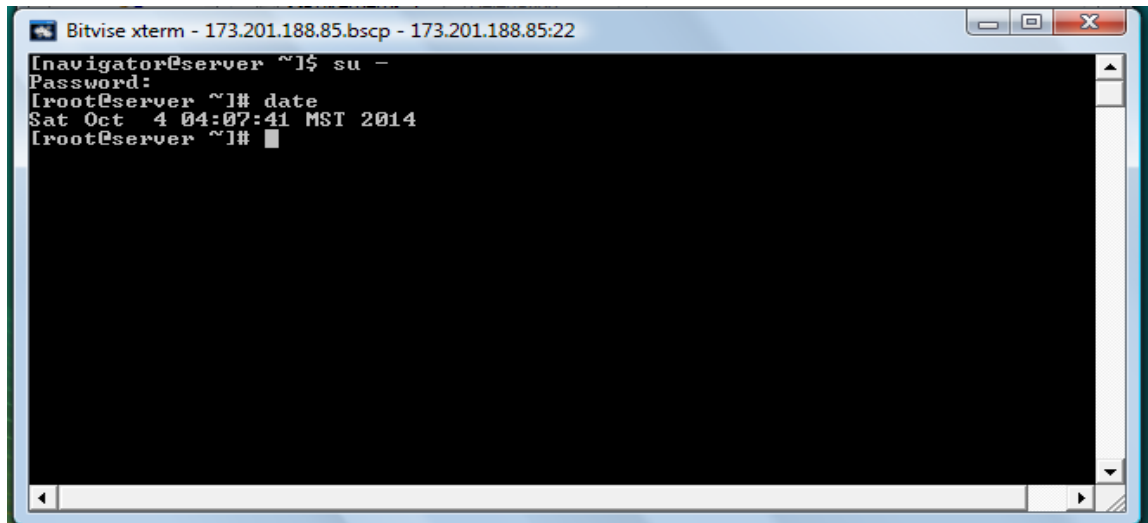

Step -1

Open the Software first and in the host give the server address which is - **173.201.188.85**. Then in port give **22** (SSH Port Address). In the Username use the **navigator**. In the password field use the password of the user **navigator** and click on the **Login** button.

Step -2

It will open a Black Terminal Window and SFTP Window. By the SFTP transfer window you can easily upload/download files to server as your desired location or vice versa. Now go to the Black Terminal window and use the root user password to take the root user privileges. For security reason the root user login was disable by me in the time of installation of the server.

```
Bitvise xterm - 173.201.188.85.bscp - 173.201.188.85:22
[navigator@server ~]$ su -
Password:
[root@server ~]# date
Sat Oct 4 04:07:41 MST 2014
[root@server ~]#
```

Step -3

Now in the Terminal window you have to write su - and give the root password for getting the root privileges. As I did today using the same password which I have given to you people.
