

HOW TO Set up your iContact Pro SPF Record

What is an SPF Record?

Sender Policy Framework (SPF) is an email validation system designed to prevent email spam. It detects email spoofing, a common vulnerability, by verifying sender IP addresses. This validation lets email providers know that your messages are legitimate and helps them make it into your subscriber's inbox. Setting up your SPF Record properly is one of the most important things you can do to ensure your email program's success.

How do I set up my SPF Record?

STEP 1

Add or modify the following SPF Record to the TXT section of your DNS records:

```
v=spf1 a mx include:icprobounce.com ~all
```

If you aren't sure where to find this setting, you can check out these guides for some of the most popular web hosts: <http://www.mail-tester.com/spf>

STEP 2

Check to make sure your SPF record is set up properly. There are lots of tools to check your SPF Record.

For example, the **Kitterman SPF Validation Tool** which can be found at:

<http://www.kitterman.com/spf/validate.html>

STEP 3
